

Task 1 – Infographic Report

For Task 1, I designed a Digital Literacy Awareness Infographic using Canva. The visual highlighted three themes: safe internet practices, professional online presence, and useful student tools. I chose a minimal layout with icons and short text blocks to avoid overcrowding. The challenge was deciding what to leave out — digital literacy is broad, but an infographic must be simple. I learned that visuals can communicate faster than text, especially for awareness campaigns. The most interesting part was experimenting with color psychology: I used blue for trust, green for growth, and red for caution. This task showed me how design choices can influence how peers absorb information.

Task 2 – Portfolio Report

For Task 2, I built my Student Digital Portfolio across GitHub, LinkedIn, and Kaggle. GitHub became my coding showcase, LinkedIn my networking hub, and Kaggle my data practice ground. Each platform reflects a different dimension of my academic journey. I realized that consistency matters — the same name, degree, and graduation year across platforms builds credibility. The hardest part was writing a one-line GitHub README that felt professional yet personal. Over the next four years, I plan to use GitHub for projects, LinkedIn for internships, and Kaggle for competitions. This task taught me that a portfolio is not just a requirement but an investment in my future identity.

Task 3 – Platforms Report

For Task 3, I explored HackerRank and Google Workspace. On HackerRank, I solved the beginner challenge “Solve Me First,” which tested my ability to apply logic step by step. The badge I earned felt motivating, like a gamified learning reward. On Google Forms, I created a five-question quiz on digital literacy, including multiple-choice and short-answer formats. Linking it to Google Sheets showed me how responses can be tracked in real time. The most insightful part was realizing how these tools complement each other: coding platforms sharpen individual skills, while collaboration tools strengthen group learning. This task reinforced the idea that digital literacy is both personal and collective.

Task 4 – Email & Etiquette Report

For Task 4, I drafted two professional emails — one to a professor requesting an extension, and another to an internship coordinator expressing interest. Both followed etiquette rules: clear subject lines, polite tone, structured body, and proper sign-off. I

also created a Social Media Do's and Don'ts checklist with five responsible practices (like verifying sources and respecting privacy) and five avoidable mistakes (like oversharing or using offensive language). In my reflection, I discussed a case where careless social media posts damaged a student's reputation during internship selection. The lesson was clear: digital communication can open doors or close them instantly. This task emphasized professionalism as a survival skill in the online world.

Task 5 – Cybercrime Report

For Task 5, I researched Phishing attacks as my case study. I described how phishing typically works: a fake email or link tricks users into sharing credentials, often targeting students with “scholarship” or “exam update” messages. Victims face consequences like stolen accounts or financial loss. My prevention checklist included eight tips, such as verifying URLs, avoiding unknown attachments, enabling two-factor authentication, and reporting suspicious activity. Two tips focused on UPI safety: never share OTPs and always confirm merchant names before payment. I also included official reporting channels like the National Cyber Crime Portal and Helpline 1930. This task made me realize that awareness is the first line of defense against cybercrime, especially for young students who are frequent targets.

✦ Each section now has a different voice and focus — design reflection, portfolio analysis, tool exploration, communication professionalism, and cybercrime awareness.

Would you like me to also combine these into a single polished report format (with intro, conclusion, and headings), or keep them separate for easy folder submission?
